RateGuard·Lite: a 60-second demonstration

Did every approved rate land correctly in Guidewire? Here, one factor was loaded wrong. The tool finds it in seconds and tells QA exactly what to fix and what to test.

All data below is synthetic (generated by `rgl sample`); nothing is real carrier data. Regenerate with `python scripts/make_demo.py`.

1. Jira story
says what should change

2. Approved workbook
the correct numbers

3. Guidewire export
what is actually loaded

4. RateGuard-Lite
compares every cell, offline

5. Verdict + report
what to fix, what to test

1. The input: a Jira story

An Oregon BOP rate revision: six tables to update, one new table, one table marked *DO NOT LOAD*.

1. The Jira story

What the business asked for (made-up ticket).

```
PC-12345: Oregon BOP rate revision

LOB: BOP
State: OR
Filing Effective Date: 03/15/2027
Renewal Effective Date: 05/15/2027
Rate Book Edition: 2025-V2
Applies to: New Business and Renewal transactions

Tables to update:
- Table 1 BLD Base Rate
- Table 21 BPP Base Rate
- Table 42 GL Class Code Factor
- Table 121 BLD Number of Stories
- Territory Factor
- Deductible Factor

New tables:
- Table 10 Vandalism Exclusion

Bypass:
- ~~Table 48~~ DO NOT LOAD (EPLI Coverage)

Comments:
Actuarial approved the attached workbook. EPLI is not part of this filing.
```

The story names the tables to change and the one to leave alone.

2. The approved workbook

The actuary's workbook has one tab per table. For **121 BLD Number of Stories**, buildings with 4 to 6 stories get a factor of **1.045**.

2. The approved workbook (from the actuary)

Tab '121 BLD Number of Stories'. The approved factor for 4 to 6 stories is 1.045.

	A	B	C
1	Stories From	Stories To	Stories Factor
2	1	1	1.01
3	11	20	1.06
4	2	3	1.0225
5	21		1.0725
6	4	6	1.045
7	7	10	1.0475

1 BLD Base Rate | 21 BPP Base Rate | 42 GL Class Code Factor | 48 EPLI Coverage | 121 BLD Number of Stories | Territory Factor | ...

Approved: the correct value is highlighted in green.

3. The Guidewire export: the mistake

After the change was loaded in PolicyCenter, the rate book was exported. In that table the 4 to 6 stories row holds **1.025** instead of 1.045, a 1.9% undercharge on every policy with a 4 to 6 story building. It is one cell among 89 (and on a real rate book, among tens of thousands).

3. The Guidewire export (what was loaded in PolicyCenter)

Sheet 'BOP_BLD_NumStories_Ext' of the export. Someone loaded 1.025 instead of 1.045.

	A	B	C
1	Rate Book Code	BOPByPeril_OR_RateBook	
2	Edition	2025-V2	
3	Table Code	BOP_BLD_NumStories_Ext	
4	Table Name	121 BLD Number of Stories	
5	Effective Date	03/15/2027	
6	Jurisdiction	OR	
7	Line of Business	BOP	
8			
9	*INTEGER*	*INTEGER*	*DECIMAL(10,4)*
10	Stories From	Stories To	Stories Factor
11	4	6	**1.025**
12	11	20	1.06
13	21		1.0725
14	7	10	1.0475
15	2	3	1.0225
16	1	1	1.01

BOP_BLD_BaseRate_Ext | BOP_BPP_BaseRate_Ext | BOP_GL_ClassCodeFactor_Ext | BOP_EPLI_Coverage_Ext | **BOP_BLD_NumStories_Ext** | BOP_TerritoryFacto

Highlighted: Stories 4 to 6 has **1.025**, the approved value is **1.045**. An eyeball review of ~90 cells can easily miss this.

Exported: the wrong value is highlighted in red.

4. Run the tool

One command, a few seconds, on the laptop, no internet. The verdict is FAIL and it names the table, the row, the approved value and the loaded value.

```
$ rgl run --approved approved.xlsx --jira jira.txt --export export.xlsx --baseline baseline.xlsx --out result

┌──────────────────────────────────────────────────────────────────────────────┐
│  FAIL   Some values in PolicyCenter don't match what was approved. Fix these before QA.  │
└──────────────────────────────────────────────────────────────────────────────┘
  Ticket           PC-12345
  LOB / State      BOP / OR
  Filing effective 2027-03-15
  Rate book        BOPByPeril_OR_RateBook
  Export edition   2025-V2
  Baseline         provided (baseline.xlsx, edition 2025-V1)
  We also checked tables outside this change against the 'before' export: provided (baseline.xlsx,
edition 2025-V1).

  8 tables analyzed  7 matched  1 with differences  0 scope violation(s)
  89 cells compared  1 critical  0 high  0 warning(s)  0 rounded match(es)

                                        What we found

  Level      What we found                              What to do
 ──────────────────────────────────────────────────────────────────────────────
  Critical   Table '121 BLD Number of Stories' (4 to 6  Change the value in PolicyCenter to
             stories): the Stories Factor value in      1.045 and export the rate book again.
             PolicyCenter is not the approved value.
             Approved 1.045, PolicyCenter has 1.025
             (1.9% lower).

(exit code 1 = FAIL)
```

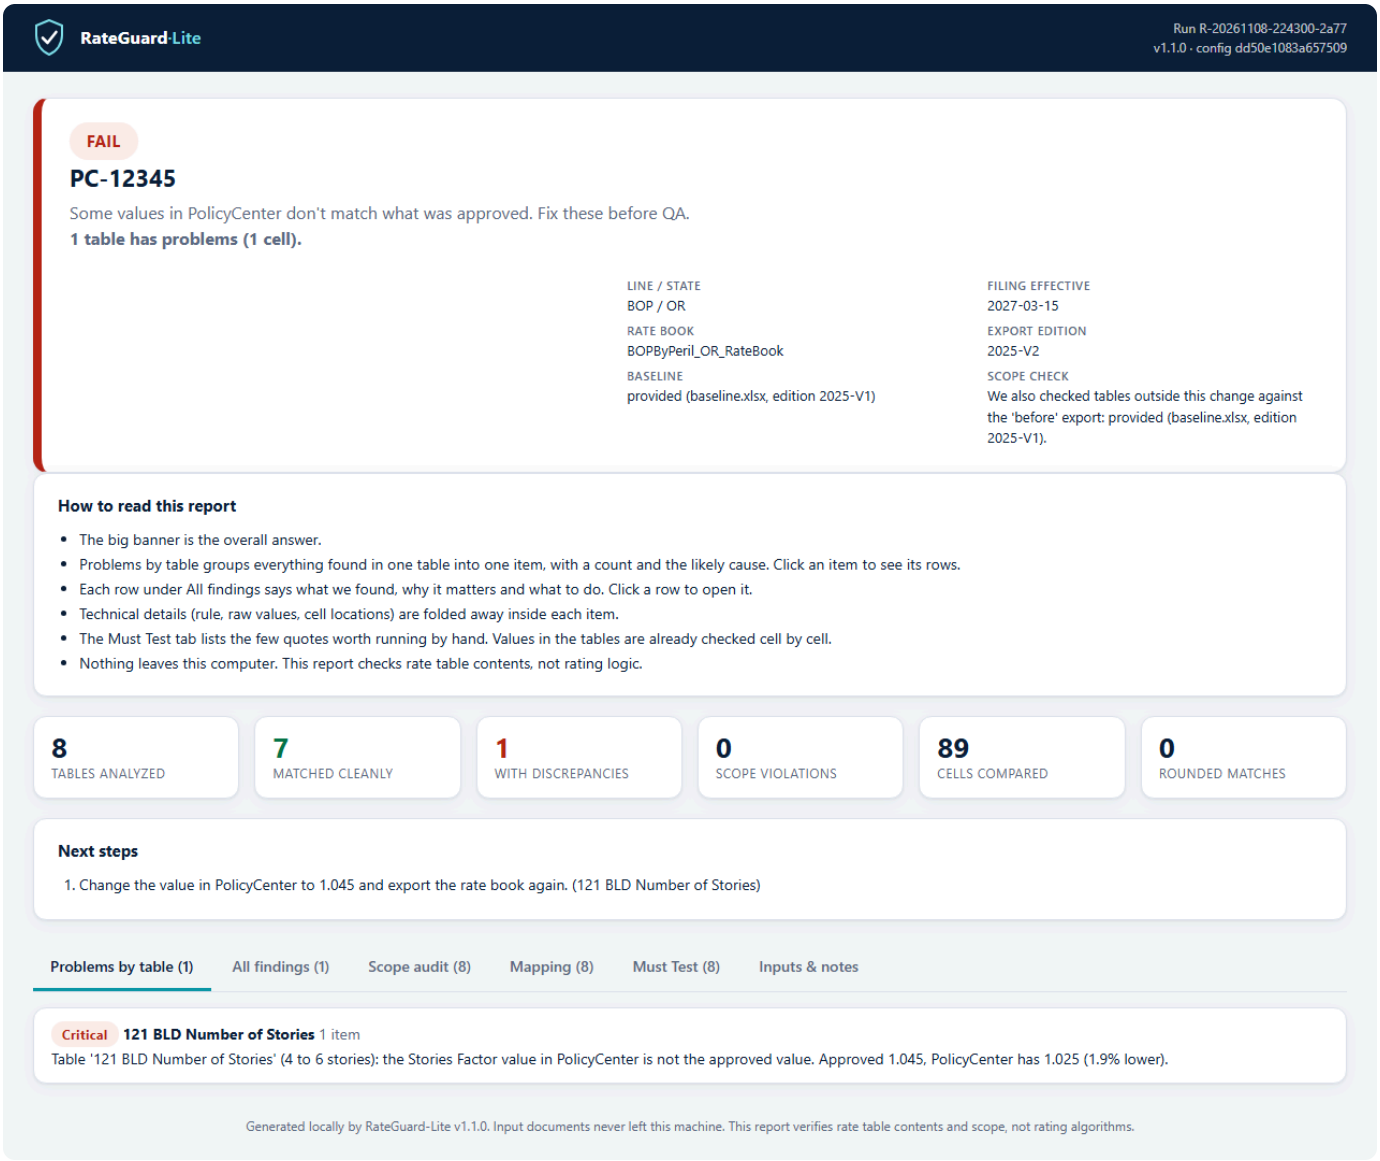

The command-line result. Exit code 1 means FAIL, so it can also gate a script.

5. The report

The HTML report opens on **Problems by table**: one item per table, with a count and a likely cause. The other tabs list every finding, every table, and the QA test script.

Top of `reconciliation_report.html`. Open the real generated report.

The whole report page.

6. What goes back to Jira and to QA

`verdict.txt` (and `jira_comment.txt`) is a short plain-words summary to paste into the ticket: what needs fixing, why it matters, what to do, and a short ranked **Must Test** list so QA tests exactly the rows that changed instead of everything.

7. verdict.txt: the short text to paste into Jira, and the Must Test list for QA

```
RATEGUARD-LITE VERDICT: FAIL — Some values in PolicyCenter don't match what was approved. Fix these before QA.
1 table has problems (1 cell).
Ticket: PC-12345 | LOB: BOP | State: OR | Filing effective: 2027-03-15
Rate book: BOPByPeril_OR_RateBook | Export edition: 2025-V2 | Baseline: provided (baseline.xlsx, edition 2025-V1)
Tables: 8 analyzed | 7 matched | 1 with discrepancies | 0 scope violation(s)
Cells: 89 compared | 1 critical | 0 high | 0 warnings | 0 rounded matches
We also checked tables outside this change against the 'before' export: provided (baseline.xlsx, edition 2025-V1).
WHAT NEEDS FIXING
 [Critical] Table '121 BLD Number of Stories' (4 to 6 stories): the Stories Factor value in PolicyCenter is not the
approved value. Approved 1.045, PolicyCenter has 1.025 (1.9% lower).
     Why it matters: Policies with 4 to 6 stories will be undercharged.
     What to do: Change the value in PolicyCenter to 1.045 and export the rate book again.
NEXT STEPS
 1. Change the value in PolicyCenter to 1.045 and export the rate book again. (121 BLD Number of Stories)

MUST TEST (top 8)
 1. After the fix, quote the exact row that was wrong in 121 BLD Number of Stories.
     Set up: Stories = 4
     You should see: In the rating worksheet, the Stories Factor for 121 BLD Number of Stories should be 1.045.
 2. Quote on the filing date using the changed 121 BLD Number of Stories table.
     Set up: New business, effective 3/15/2027; Stories = 1.
     You should see: The rating worksheet should use the new rates (rate book 2025-V2). Also, the Stories Factor for 121
BLD Number of Stories should be 1.01. It changed by 1.0% in this filing.
 3. Quote a new business policy effective the day before the filing date.
     Set up: New business, effective 3/14/2027.
     You should see: The rating worksheet should use the old rates (rate book 2025-V1).
 4. Renew a policy with an effective date on or after the filing date.
     Set up: Renewal, effective 5/15/2027.
     You should see: The rating worksheet should use the new rates (rate book 2025-V2).
 5. Quote a policy that uses the new row in 10 Vandalism Exclusion.
     Set up: Vandalism Excluded = FALSE
     You should see: In the rating worksheet, the Credit Factor for 10 Vandalism Exclusion should be 1.
 6. Quote a policy that uses the new row in 42 GL Class Code Factor.
     Set up: Class Code (Building/Classification screen) = 0099
     You should see: In the rating worksheet, the Class Factor for 42 GL Class Code Factor should be 1.11.
 7. Make a mid-term policy change on a policy whose term started before the filing date.
     Set up: A policy that started before 3/15/2027; add a premium-bearing change effective on or after 3/15/2027.
     You should see: The rating worksheet should keep the original rates (rate book of the term inception), not the new
ones.
 8. Quote exactly on the lower edge of a 121 BLD Number of Stories band, where the factor changes.
     Set up: Stories = 2
     You should see: In the rating worksheet, the Stories Factor for 121 BLD Number of Stories should be 1.0225. It changed
by 1.0% in this filing. One step lower (Stories = 1) should show the previous band: 1.01.
Full candidate list: test_scenarios.xlsx > All Candidates
```

Plain-language findings, next steps and the Must Test list. Files: verdict.txt, jira_comment.txt.

What this shows

- It checks **every approved cell** against Guidewire, not a sample.
- The answer is plain: table, row, approved value, loaded value, difference, what to do.
- It runs **offline**; files never leave the laptop.
- It also catches missing or extra rows, shifted bands, blanks loaded as wildcards, undeclared changes, wrong dates and editions (see FINDING_CATALOG.md).
- It checks tables, not rating logic or premiums, and it helps QA rather than replacing it.

Try it yourself: INSTALL.md, then `rgl sample --out demo`. On real files: FIRST_REAL_RUN.md.
